Project title	Output (investment of research security funds)	Performance objective	Performance indicator	Target outcome	Reported Outcome
Effectiveness of current network security mechanisms	$25,162 invested to evaluate the effectiveness of current network security	Test the effectiveness of current network security mechanisms at the university	Gaps in prevention and detection controls identified and mitigation plan put in place	Identify gaps in prevention and detection controls to mitigate risks to research security	The test identified many areas of strength for the university in cybersecurity, especially in terms of identifying and responding to potential threats. It also highlighted a security architecture that was effective and verified the quality of the investments we've been making over the past several years. As with any test of this kind, both short and long term improvements have been identified. Short term issues were remediated as part of a remediation plan, and long-term goals incorporated into our IT strategic plan and information security roadmap.
